
Firefly Documentation

Release 1.0

Oliver Nicholas

December 18, 2012

CONTENTS

Firefly provides graphing of performance metrics from multiple data centers and sources.

USER'S GUIDE

This part of the documentation is mostly for instruction in using Firefly.

1.1 Foreword

1.2 Installation

1.3 Quickstart

1.4 Tutorial

1.5 Configuration

API REFERENCE

2.1 API

2.1.1 Data Server

2.1.2 Data Source

```
class firefly.data_source.DataSource(*args, **kwargs)
```

Base class for Firefly Data Sources

```
list_path(path)
```

given an array of path components, list the (presumable) directory

2.1.3 UI Server

2.1.4 Util

```
firefly.util.b58decode(encoded)
```

Decodes a base58 string to its integer value

```
firefly.util.b58encode(value)
```

Encodes an integer value as a base58 string

```
firefly.util.generate_access_token(key, duration=60)
```

Generate an access token valid for the given number of seconds

```
firefly.util.import_module(dotted_path)
```

Import a module path like ‘a.b.c’ => c module

```
firefly.util.import_module_class(dotted_path)
```

Import a module + class path like ‘a.b.c.d’ => d attribute of c module

```
firefly.util.last_dot_splitter(dotted_path)
```

Split a string on the last dot.

‘aaa.bbb.ccc’ => (‘aaa’, ‘bbb’, ‘ccc’) ‘aaa’ => (‘’, ‘aaa’)

```
firefly.util.setup_logging(logger_name)
```

Sets up logging to stdout for a service script.

```
firefly.util.verify_access_token(token, key)
```

Verify that the given access token is still valid. Returns true if it is, false if it either failed to validate or has expired.

A token is a combination of a unix timestamp and a signature

2.2 Data Sources

Each of these classes inherit from `DataSource` and provide a way for Firefly to ingest data.

2.2.1 Ganglia

2.2.2 StatMonster
